[Google Cloud Run Brings Serverless And Containers Together](#)

## **GOOGLE CLOUD RUN (GCR)**

[cloud.google.com/run](https://cloud.google.com/run)

Built on Knative, Google Cloud Run is a fully managed compute platform that automatically scales stateless containers.

## **RED HAT OPENSIFT SERVERLESS**

[openshift.com/learn/topics/serverless](https://openshift.com/learn/topics/serverless)

Red Hat OpenShift Serverless delivers Kubernetes-native, event-driven primitives for microservices, containers, and compatible Function-as-a-Service (FaaS) implementations.

Cloud Run is a fully managed compute platform that automatically scales your stateless containers. Cloud Run is serverless: it abstracts away all infrastructure management, so you can focus on what matters most—building great applications. Run your containers in fully managed Cloud Run or on Anthos, which supports both Google Cloud and onpremises environments. Cloud Run is built upon an open standard, Knative, enabling the portability of your applications.

- **Write code your way** using your favorite languages (Go, Python, Java, C#, PHP, Ruby, Node.js, Shell, and others)
- **Abstract away** all infrastructure management for a simple developer experience
- **Only pay** when your code is running

OpenShift Serverless provides out-of-the-box traffic routing and security capabilities. This offering combines Red Hat Operators, Knative, and Red Hat OpenShift. Combined, these tools allow stateless and serverless workloads to run across OpenShift deployments on private, public, hybrid, or multi-cloud environments with automated operations.

OpenShift Serverless helps developers to deploy and run applications that will scale up or scale to zero on-demand. Applications are packaged as OCI compliant Linux containers that can be run anywhere.

Applications can be triggered by a variety of event sources, such as events from your own applications, cloud services from multiple providers, Software as a Service (SaaS) systems and Red Hat Services (AMQ Streams).

OpenShift Serverless applications can be integrated with other OpenShift services, such as OpenShift Pipelines, Service Mesh, Monitoring and Metering, delivering a complete serverless application development and deployment experience.
